An understanding of the brain

- ~100B neurons
- ~100T synapses
- also ~100B glia

¹Herculano-Houzel, S. The human brain in numbers: a linearly scaled-up primate brain. Frontiers in human neuroscience 3, 31 (2009)

 complex so behind
processes

An understanding of the brain

An understanding of the brain

- The most recent estimate puts the number of neurons in the human brain at 86B.
- 2. Experiments provide us with direct information.
- 3. They study the brain at different levels.
- 4. There's no right level. It depends on the question being investigated.

Experiments provide a window into the brain

Multiple scales of experiments goes here

periments provide a window into the brain

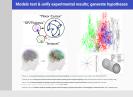

- 1. There is so much data out there now, as we embrace Open Science.
- 2. Models/theory are necessary for:
- 3. combining independent experimental results into unified theories
- 4. exploring these complex systems across wider range of conditions
- 5. generating new testable hypotheses
- 6. RNNs are appropriate for lots of projects, for example.
- 7. So are whole brain neural mass models.
- But, to really understand the underlying mechanisms that give rise to emergent behaviour, we must model the brain at biophysically detailed levels.

Models test & unify experimental results; generate hypotheses

The model life cycle

- tweaked version of life cycle figure from paper goes here.
- remove NeuroML, add data

The NeuroML ecosystem for standardised multi-scale modelling in neuroscience The model life cycle

| • | tweaked version of life cycle figure from paper goes here. |
|---|--|
| | remove NeuroML, add data |
| | |

- 1. The figure shows a simplified model life cycle. Can be much more complex in practice.
- 2. Lots of tools out there for each step.
- 3. But there's are issues—fragmentation, lack of interoperability, so many APIs.

Standards enable FAIR neuroscience

- NWB/BIDS for data
- NeuroML/SBML etc. for modelling
- Add logos

The NeuroML ecosystem for standardised multi-scale modelling in neuroscience

NWB/BIDS for data
 NeuroML/SBML etc.
 Add logos

Standards enable FAIR neuroscience

Standards enable FAIR neuroscience

- 1. Standards allow the representation of data and models in specific, agreed formats.
- 2. They're not neuroscience specific, of course—even programming languages have standards.
- 3. More importantly, if one knows what the data is going to look like, one can then develop tools and APIs around it.
- 4. And instead of everyone writing a tool for their own standard, every tool anyone writes for the one standard can be used with everyone's data.

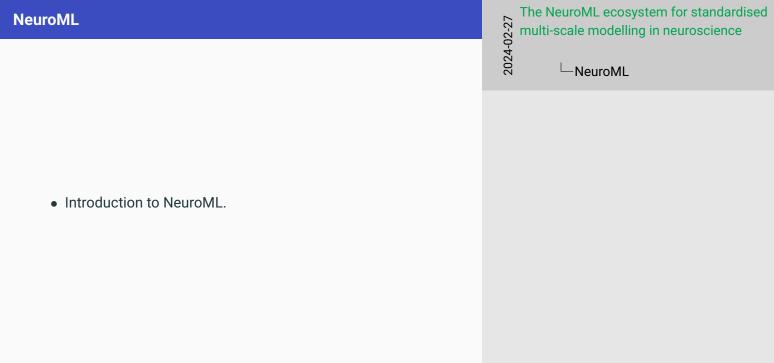

The NeuroML ecosystem for standardised multi-scale modelling in neuroscience

But, too many standards?

XKCD here

But, too many standards?

- 1. In neuroscience, we're fortunate enough to not have the issue of having too many standards.
- 2. There are only a few standards in biophysically detailed modelling, and as we'll see, we ensure that these few remain interoperable.
